PM: Hey Ana! Thanks for chatting today. I'd love to understand how you currently track your expenses.

User: Honestly, I don't. I've tried spreadsheets, but they're too much effort for small things like a coffee or bus fare.

PM: Got it. So ideally, what would a solution look like for you?

User: I just want something dead simple. A fast way to log an expense and then see where my money went at the end of the month. No fluff.

PM: Would you say you need features like multi-currency, shared budgets, or syncing with your bank?

User: Nope. Just me. I don't need anything fancy—just the basics.

PM: Great. Let me repeat what I'm hearing so far: • You want to record an expense quickly. • You want a monthly summary showing how your money is being spent. • You prefer a simple UI that loads fast and works on desktop. • You don't need multi-user support or integrations. Is that right?

User: 100%.

PM: Awesome. So imagine this: • You open a simple app. • You click "Add Expense," fill in amount, category, and date, and hit save. • A toast confirms it's saved. • You can go to a dashboard and see totals grouped by category—like Food, Transport, etc.—with a nice little chart. Would that meet your needs?

User: That sounds perfect!

PM: Now for tech setup—would you be okay running something locally with Docker?

User: Sure, as long as it's just docker compose up or something that simple.

PM: Cool. We'll make it easy to deploy and use just one container. SQLite for storage, FastAPI backend, and a React front end with two pages: /add for the form, /dashboard for the summary.

User: That's exactly the kind of no-fuss app I need.

PM: Great! Lastly, any wishlist items for later?

User: Maybe importing a CSV of my bank statements. Or even some insights, like "you spent more on food this month."

PM: Got it. We'll keep those in mind for after the MVP.
